

Project Title

Build A Grocery Android App – Project

Problem Statement

As we can't remember everything, users frequently forget to buy the things they want to buy. However, with the assistance of this app, you can make a list of the groceries you intend to buy so that you don't forget anything.

Introduction

In this project, we are using MVVM (Model View ViewModel) for architectural patterns, Room for database, Coroutines and RecyclerView to display the list of items

Technologies-Used

1. MVVM (Model View ViewModel)

MVVM architecture in android is used to give structure to the project's code and understand code easily. MVVM is an architectural design pattern in android. MVVM treat Activity classes and XML files as View. This design pattern separates UI from its logic. Here is an image to quickly understand MVVM.

2) ROOM Database

Room persistence library is a database management library and it is

used to store the data of apps like grocery item name, grocery item

quantity, and grocery item price. Room is a cover layer on SQLite

which helps to perform the operation on the database easily.

3)RecyclerView

RecyclerView is a container and it is used to display the collection of

data in a large amount of data set that can be scrolled very effectively by maintaining a limited number of views.

4)Coroutines

Coroutines are a lightweight thread, we use a coroutine to perform

an operation on other threads, by this our main thread doesn't block

and our app doesn't crash.

ACKNOWLEDGEMENT :

I would like to convey my heartfelt gratitude to Mr Sandeep Doodigani for his tremendous direction and assistance in the completion of my project and for the SmartInternz platform for providing this opportunity.

I would also like to thank him for providing me with this wonderful opportunity to work on a project with the topic Grocery App. This project would not have been accomplished without their help and insights.

Vunnam Vaishalini
